

Motivation and Background

The Wizard-of-Oz (WoZ) method is a powerful solution in the field of human-robot interaction (HRI). It allows evaluation and refinement solutions before full implementations, bringing agility to development. However, WoZ is fraught with methodological challenges that can compromise the credibility and reproducibility of experiments. In this project, we propose HRIStudio, a framework to automate, record, and track of documents related to WoZ experiments, making the method more broadly acceptable and rigorous.

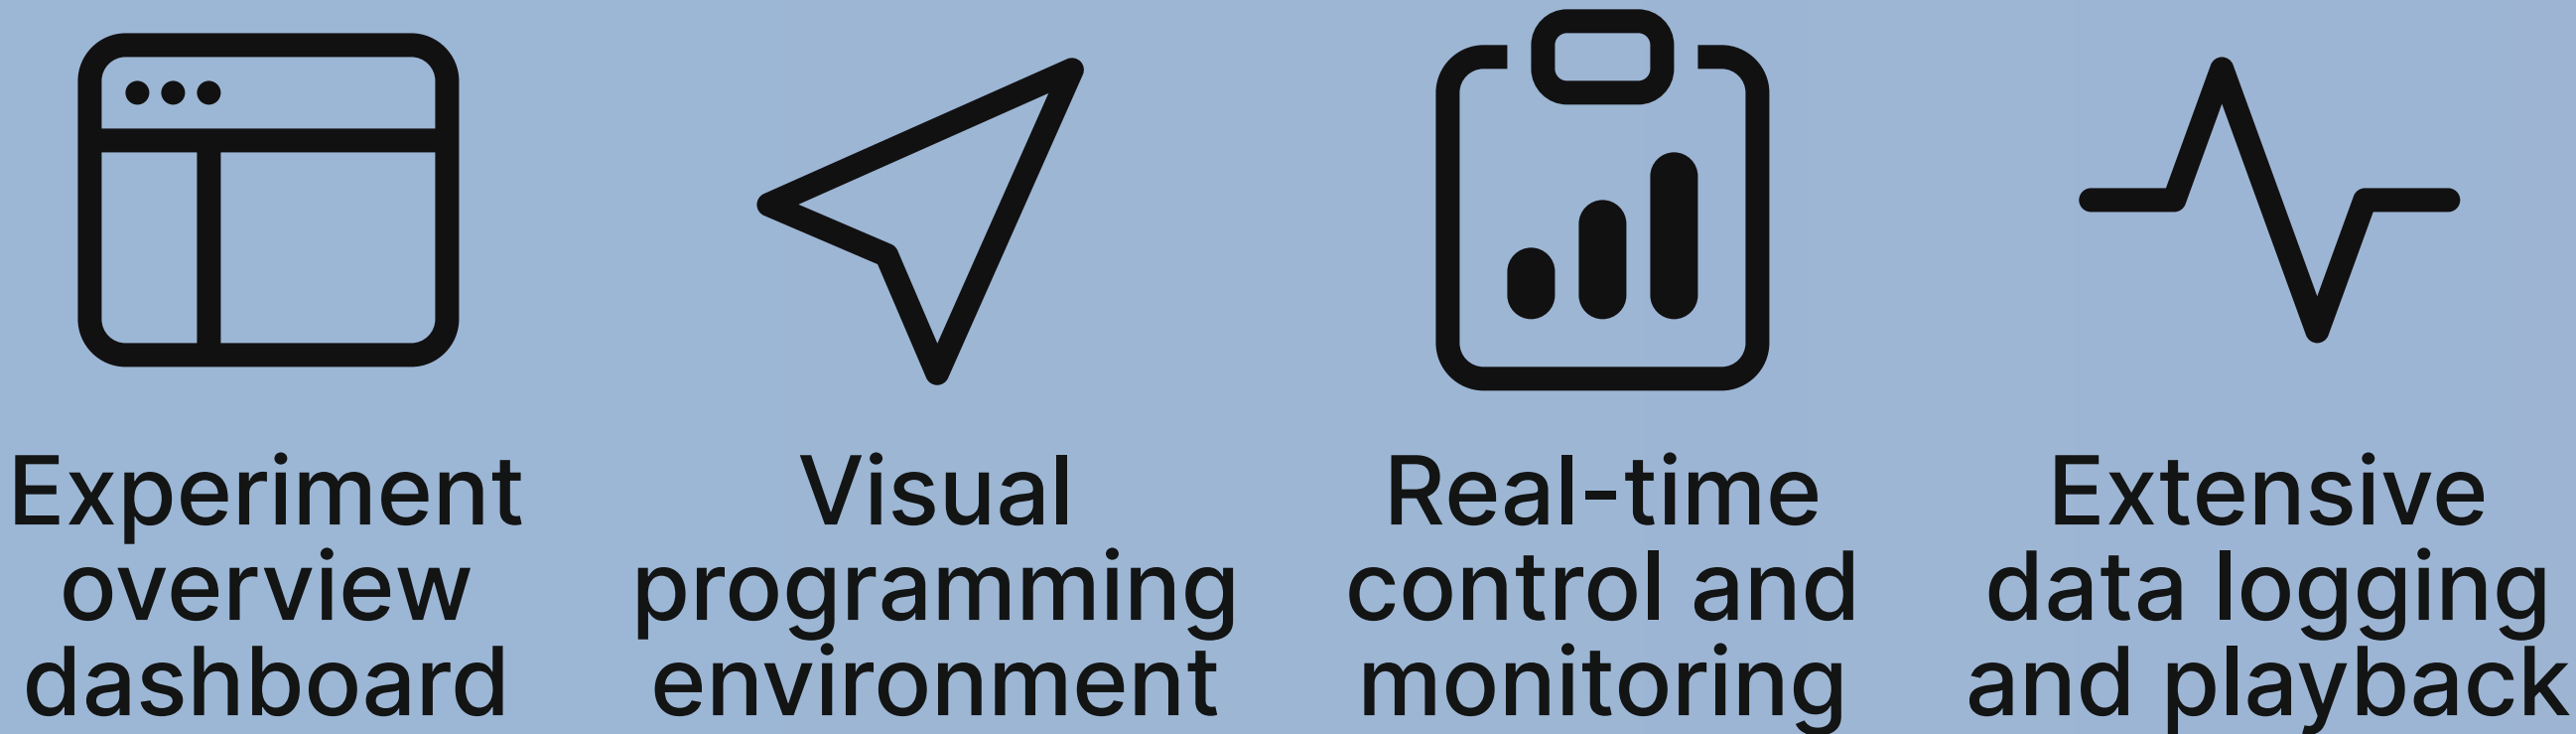

The WoZ approach in HRI

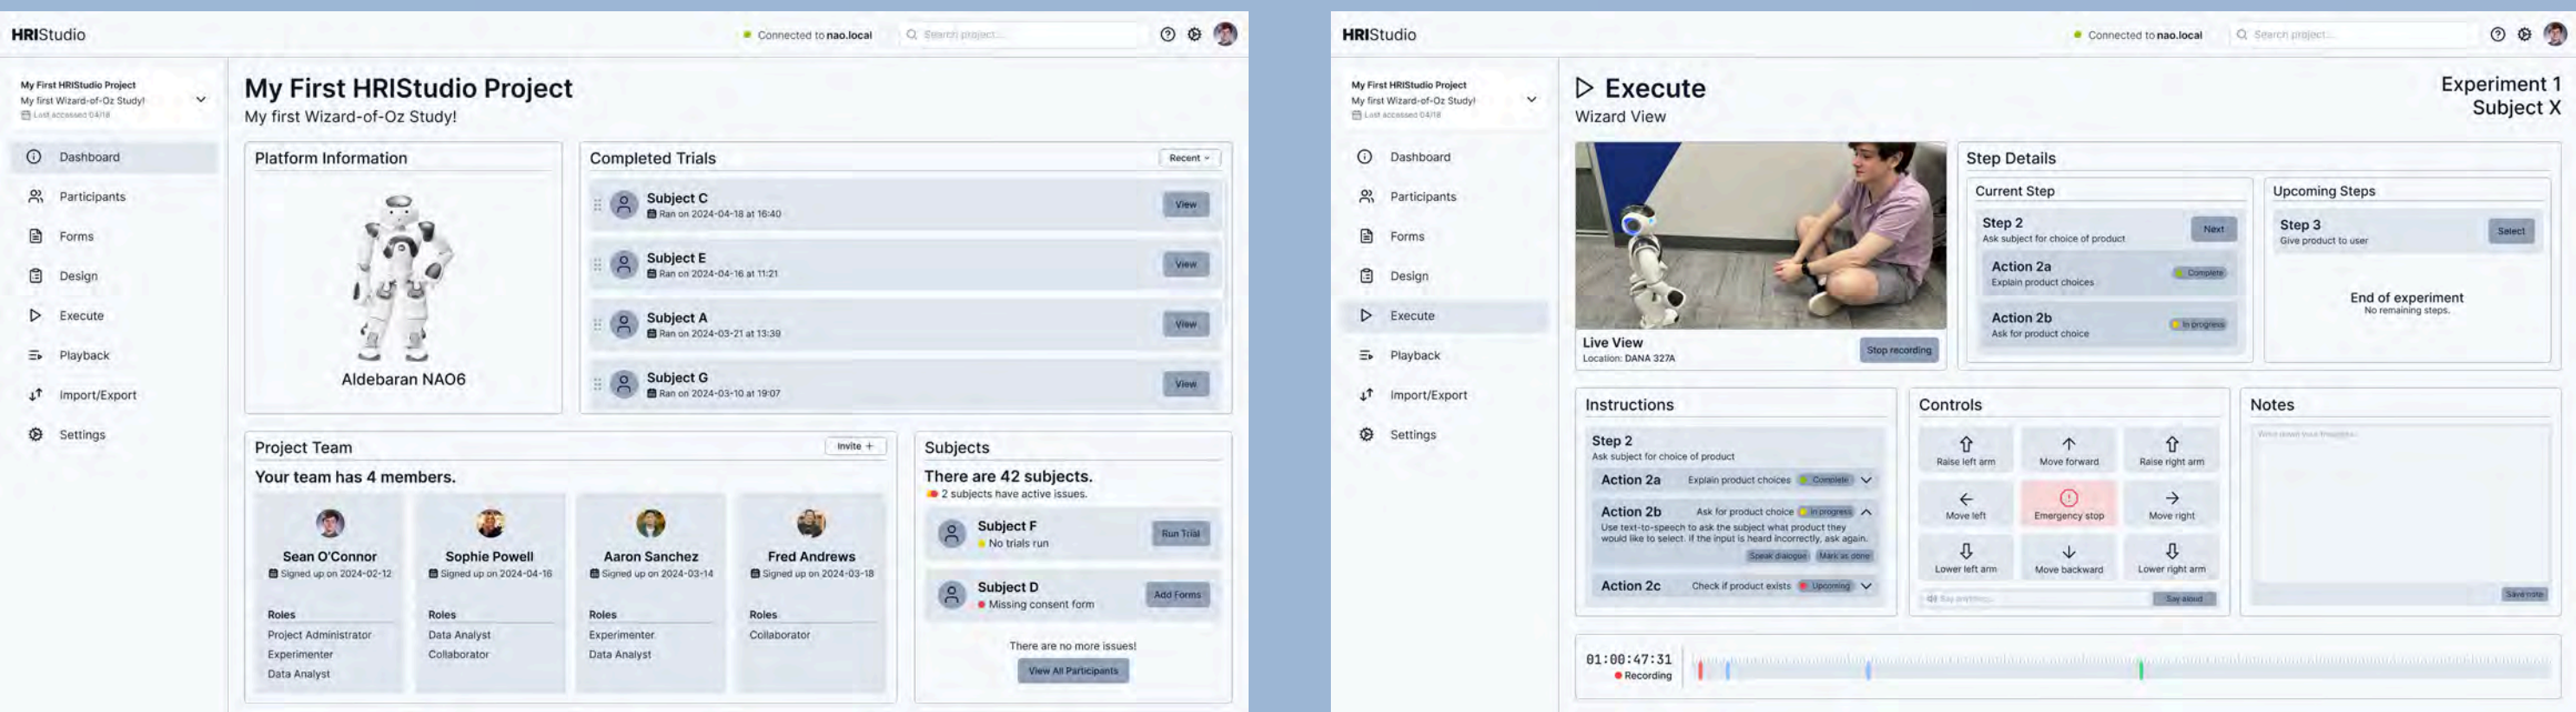

Design and Features

HRIStudio is a web-based platform for intuitive WoZ experiment design and execution, being developed with portability and ease of deployment in mind.

Key Features

The platform offers user-friendly interfaces for experiment design, execution, and playback, easing entry into HRI research.

Development Roadmap

Our development roadmap focuses on building core functionalities.

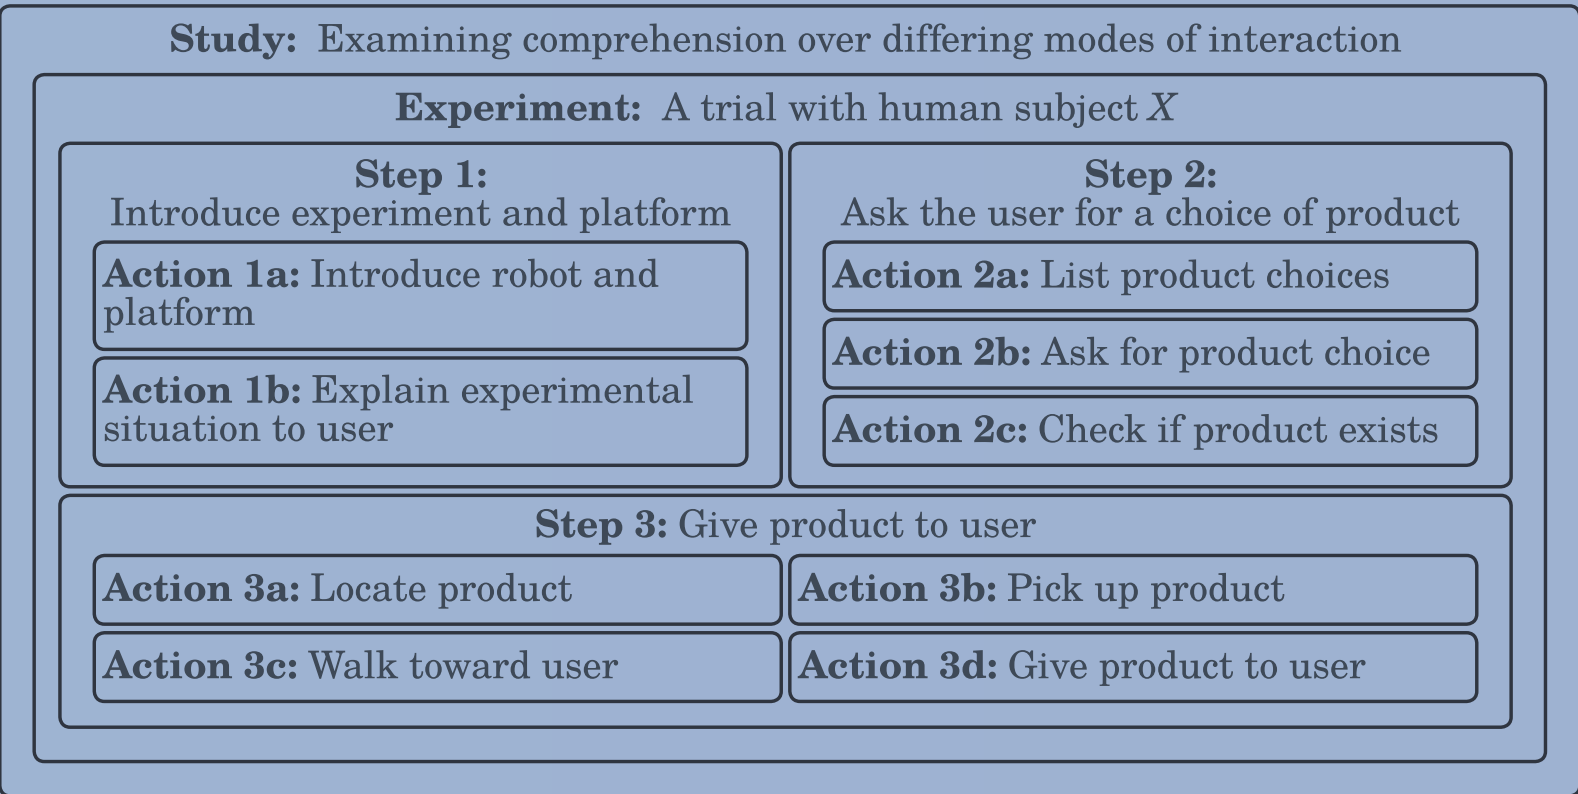

Challenges include seamless integration of web and robot control modules, and creating a visual programming environment.

Experiment Structure

HRIStudio uses a hierarchical structure to define user studies.

Study → Experiment → Step → Action

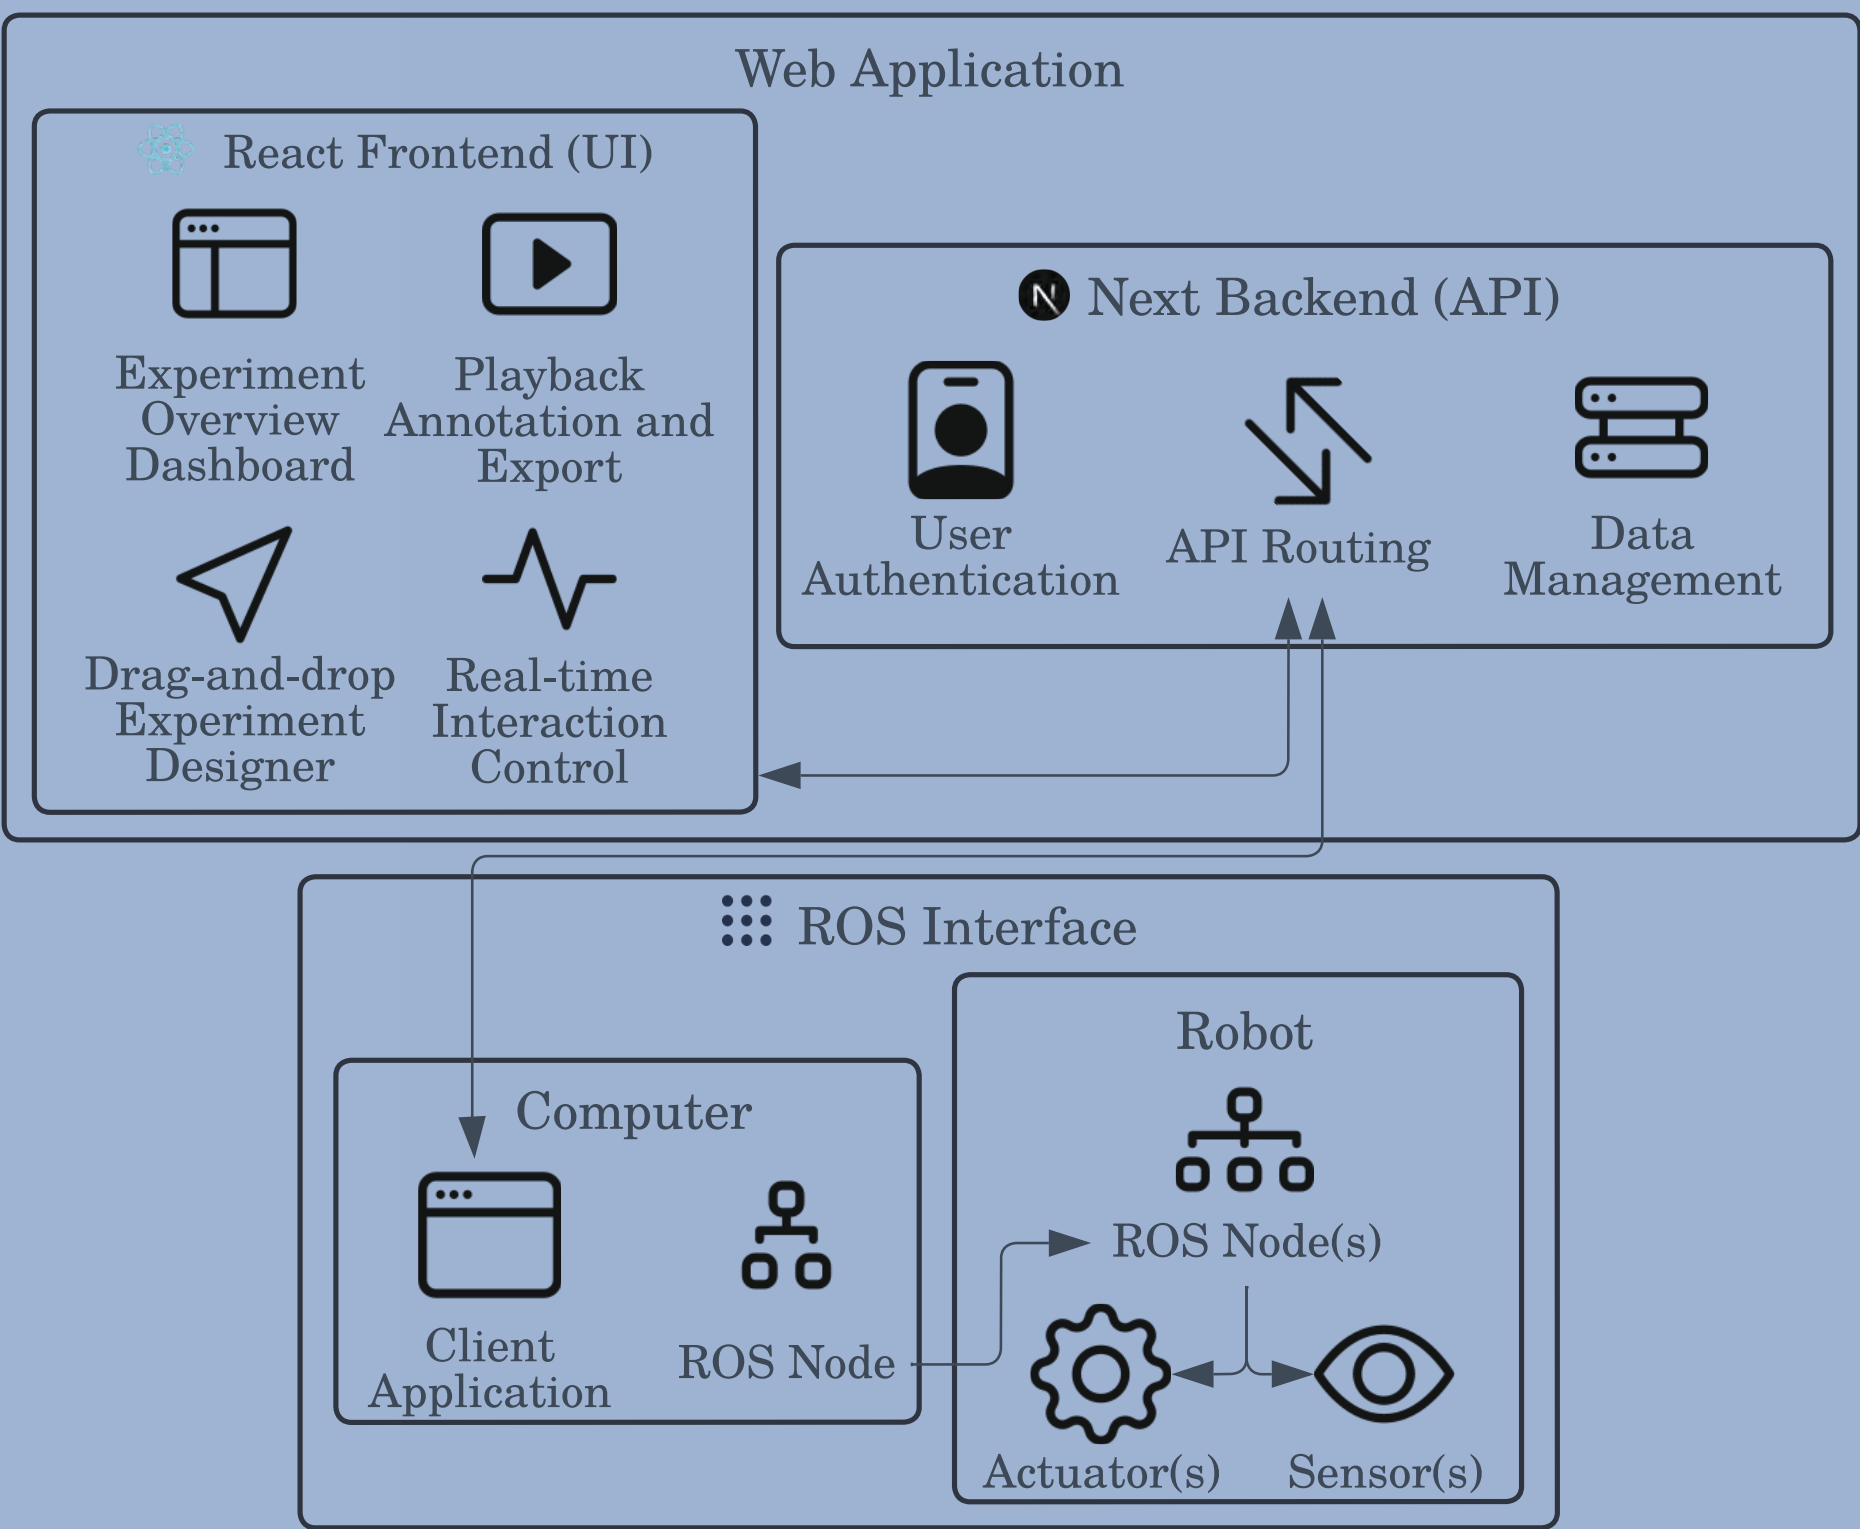

This design enables flexible, event-driven execution, allowing natural interactions across replications with different users.

System Architecture

Our system integrates a web frontend with a Next.js backend API and ROS node, enabling integration with various robotic platforms through a modular architecture.

HRIStudio system architecture
